The chemical structure shows a complex molecule with several functional groups and a specific stereochemistry. It features a p-phenylene ring substituted with a Pr-n group. The ring is connected via a methylene group to a chiral center (marked with a wedge bond) bearing an amino group (NH_2) and a carbonyl group (C=O). This carbonyl is part of an amide linkage (NH-C=O) connected to a sulfur atom (S), which is further linked to a phenyl group (Ph) and a carbonyl group (C=O). The latter carbonyl is part of an amide linkage (NH-C=O) connected to a piperidine ring. The piperidine ring is substituted with a guanidino group ($\text{H}_2\text{N-C(=NH)-NH}_2$).

AB In order to investigate the mechanism of kinin release leading to vascular

symptoms in acute interstitial-edematous pancreatitis, the novel, selective inhibitors of tissue kallikrein, (2S,2'R)-2-(2'-amino-3'-(4'-chlorophenyl)propanoylamino)-N-(3-guanidinopropyl)-3-(1-naphthyl)propanoamide (FE999024, CH-2856), and of plasma kallikrein, (2'S,2''R)-4-(2'-(2''(carboxymethylamino)-3''-cyclohexyl-propanoyl amino)-3'-phenyl-propanoylamino)piperidine-1-carboxamidin (FE999026, CH-4215), were used in exptl. caerulein-induced pancreatitis in rats. Edema formation and plasma protein extravasation during the 2 h infusion of caerulein were inhibited in a dose-dependent manner by i.p. pretreatment with FE999024 (7-60 $\mu\text{mol kg}^{-1}$) while FE999026 had no effect at the same doses. Haemoconcn. and hypovolemia associated with the pancreatic edema formation during pancreatitis were significantly attenuated by FE999024 at a dose of 20 $\mu\text{mol kg}^{-1}$. The reduction in circulating plasma volume was not affected by FE999026. Accumulation of amylase and lipase in the pancreas was dose-dependently reduced by FE999024 while enzyme activities in the blood serum were increased by FE999024 at 60 $\mu\text{mol kg}^{-1}$ indicating improved enzyme removal from the tissue. Enzyme activities in the tissue and in the blood remained unaffected by FE999026. FE999024 (20 $\mu\text{mol kg}^{-1}$) largely inhibited increased tissue kallikrein-like activity in the pancreas during acute pancreatitis and also strongly attenuated influx of plasma kallikrein into the tissue. FE999026 (20 $\mu\text{mol kg}^{-1}$) significantly inhibited plasma kallikrein-like activity in the pancreas but had no effect on tissue kallikrein-like activity. In conclusion, vascular kinin-mediated symptoms observed during edematous pancreatitis in the rat are caused by the action of tissue kallikrein in the pancreas whereas an involvement of plasma kallikrein seems to be unlikely.

IT 488821-28-9, FE 999026

RL: BSU (Biological study, unclassified); BUU (Biological use, unclassified); BIOL (Biological study); USES (Uses)
(CG 4215, selective plasma kallikrein inhibitor; involvement of tissue kallikrein but not plasma kallikrein in development of symptoms mediated by endogenous kinins in acute pancreatitis in rats)

AB The present invention relates to the compns., methods, and applications of a novel approach to selective cellular targeting. The purpose of this invention is to enable the selective delivery and/or selective activation of effector mols. to target cells for diagnostic or therapeutic purposes. The present invention relates to multi-functional prodrugs or targeting vehicles wherein each functionality is capable of enhancing targeting selectivity, affinity, intracellular transport, activation or detoxification. The present invention also relates to ultralow dose, multiple target, multiple drug chemotherapy and targeted immunotherapy for cancer treatment.

 AB A series of tripeptide aldehyde derivs. containing variations at the P3
 subsite and the amino terminus has been prepared and evaluated for
 trypsin-like serine protease inhibition. These compds. exhibit strong in
 vitro inhibition of human plasma kallikrein (HPK), porcine
 pancreatic kallikrein (PPK) and human plasmin (HP). As
 suspected from an examination of a related crystal structure, the presence of a
 hydrophobic residue (adamantyl) at the amino terminus dramatically
 improves the binding to PPK. The adamantyl group, however, represents a
 peak in binding; larger residues cause the binding to be reduced, and thus
 are less well accommodated in this subsite. Although both HP and HPK also
 can accept large mol. volume at the amino terminus, they do not exhibit the
 same preference for large residues at this subsite that is demonstrated by
 PPK. Selectivity differences also are observed with P3 subsite substitution;
 with PPK preferring a bulky, but compact side-chain (t-butyl) and HP and
 HPK preferring a more extended (e.g. benzyl) group.
